Trans Haul demo — read-out and next steps

7 November 2026 · Sam Sahota, Your AI Ltd

The demo on Friday 6 November landed: Paul said the platform has "definitely legs" as an operator platform that pulls manual workarounds into one place. The deal now turns on two things: proving the data arrives automatically, and the scope Paul and Samantha send back next week.

How the meeting went

Paul and Samantha bought the direction. They did not yet buy how the data gets in, and that is now the deciding question.

Topic	What was said	What it tells us
Director dashboard	Paul: the measures are "exactly what I'm looking for"	The five questions are right; keep them as the front page
Driver app and customer tracking	Paul checked the driver app is part of the setup: "Yeah, okay, good"	Wanted, not a distraction; keep it in the offer
Overall	Paul: "definitely legs"; it brings the manual workarounds into one place and gives the team structure	Strong buying signal
Data input	Paul asked three times how the data gets in. Our answer in the room was "it would still be manual input"	The biggest objection, and our answer made it worse. Correct it in writing (follow-up email)
Product identity	Paul: "Is this an operating platform, or is it a TMS?" He does not want to build a TMS	Position it as an operator platform that sits on top of Vigo
Look and feel	Samantha: "looks very much like a Tableau dashboard"	Visuals alone won't set us apart. The value is the automation and the workflow
Who it is for	Samantha: the operations and transport manager views matter most; it must help them do their job	Lead the next round with those two views, not the director view
Market feedback	Paul told ~150 hauliers; a reporting dashboard alone is	The resale product must cover compliance, plan vs

Topic	What was said	What it tells us
	not enough	actual P&L, and H&S and HR processes, not just charts
Automation ask	Paul: read Tachomaster's scheduled email reports (daily odometer, drivers' hours) and fill plan vs actual with no one clicking	Prove this one feed working and the objection goes away
Commercials	No trial price agreed. Samantha suggested passing software costs through open-book. Sam offered a large discount, half up front	Price after scope; separate build, platform fee and pass-through costs
Timing	Paul is at full stretch: peak season, a 12-week course, a two-day tribunal. Likely pause to January unless Sam can build on his own	Agree scope and price fast, then build without needing Paul's time

The correction we owe them: the portal does not need anyone to retype data. It reads Vigo, Tachomaster and Xero directly, or reads the exports and scheduled email reports they already produce. Manual entry is only for things no system holds today, such as walkaround checks and actions.

What it means for the product

Sell an operator platform: one place for compliance, plan vs actual costs, PODs, actions and policies, fed automatically from the systems a haulier already runs. It sits on top of the TMS and never replaces it.

This is wider than the dashboard-only product we discussed before the meeting. Paul's 150-haulier feedback and his own description of what he built in SharePoint both point to it. The line we hold is Paul's: no routing, invoicing, job booking or drivers' hours calculation. Those stay in Vigo, Xero and Tachomaster.

Module	Proposed	Why
Director dashboard (the five questions)	Core	What Paul asked for; the front page for every haulier
Operations and transport manager views	Core	Samantha's priority: the daily working tool
Plan vs actual costs and contribution	Core	Paul's "worth its weight" use of Tachomaster data
PODs and unbilled work	Core	Direct cash impact; every haulier has it

Module	Proposed	Why
Fleet and driver compliance (licences, infringements, MOTs, defects)	Core	Part of Paul's operator-platform list
Actions and follow-ups	Core	Turns exceptions into owned tasks
Policies and procedures (H&S, HR, SOPs)	Core	Part of Paul's operator-platform list; replaces the SharePoint hub
Automated data feeds (Vigo, Tachomaster emails, Xero, file imports)	Core	Without this nobody buys; set up per haulier
Driver app (walkarounds, check-ins, photo PODs)	Add-on	Some hauliers prefer paper or their TMS app (Samantha's point)
Customer tracking portal and delivery emails	Add-on	Customer-facing; only where the TMS doesn't already do it
Cash and invoice-finance view (debtors, Bibby)	Add-on	Director-only; needs a finance connection
Driver cover planning	Add-on	Edges towards TMS planning; offer where wanted

This split is our proposal. Paul and Samantha set the final list in their scope session (workbook below).

Risks to manage before pricing

The biggest risk is pricing a build before we know how each data source can be read. Settle that first.

Risk	Effect	How we handle it
Vigo API access is only a verbal yes (via Dagmar); Tachomaster will build one only "if requests are specific"	Automation, the main selling point, could slip or cost more	Request API documentation now. Price a fallback that reads scheduled email reports and CSV exports, so go-live never waits on a vendor
Scope drifts towards a TMS	Open-ended build, margin erodes	A written "not in scope" list (routing, invoicing, job booking, drivers' hours calculation) and change control in the contract

Risk	Effect	How we handle it
Paul has no capacity until January	Decisions stall, build waits	One named decision-maker for scope sign-off, one onsite discovery day, then build without Paul's time
Two parties, one product: Trans Haul trial and Clearpath resale	Unclear who owns the platform and who earns on resale	Two agreements: a pilot agreement with THEL, a partner agreement with Clearpath. Your AI Ltd keeps the platform IP; each haulier owns its data
Running costs of £100–150 a month for software subscriptions	Cash out before income	Pass through at cost, open-book (Samantha's suggestion). 50% of the build fee up front
Driver and staff personal data (licences, tachograph, locations)	UK GDPR obligations	A data processing agreement in the contract; UK hosting; role-based access
"Looks like Tableau"	Seen as a reporting tool, priced like one	Next demo leads with a live automated feed and the ops and transport manager views
The construction build lands at the same time (end of December or early January)	Delivery capacity	Agree a delivery date after both scopes are known; stage the Trans Haul build

Next steps

The fastest route to a signed trial is to prove one automated feed while Paul and Samantha settle the scope, then price within a week of receiving it.

- ☐ **Sam** — send the follow-up email (below), with the scope workbook, by Monday 9 November
- ☐ **Paul** — follow up the NDA, by Friday 13 November
- ☐ **Paul** — forward two or three recent Tachomaster scheduled report emails (daily odometer, drivers' hours) so Sam can build the automated feed, by Friday 13 November
- ☐ **Paul / Dagmar** — introduce Sam to Vigo to request API documentation and a read-only key, by Friday 13 November
- ☐ **Samantha and Paul** — scope session: core vs add-ons, data sources, price point; send the plan to Sam by Friday 20 November
- ☐ **Sam** — working proof: Tachomaster email report read automatically into plan vs actual costs, shown on a short call, by Friday 20 November
- ☐ **Sam** — onsite discovery day with the operations and transport team, line by line through the views, by Friday 27 November

- ☐ **Sam** — proposal and pilot agreement with figures, five working days after the scope, by Friday 4 December
- ☐ **All** — agree commercials, sign, 50% invoice, build starts, by Friday 11 December
- ☐ **All** — first version review in January, by Friday 15 January 2027

If the scope arrives later, every date after it moves by the same amount. The proof does not depend on the scope and can go ahead now.

Follow-up email (draft)

Send Monday. It corrects the data-input answer in writing and asks for the three things that let us move without taking Paul's time.

To: Paul Dyer; Samantha Hardy
Subject: Trans Haul operator platform — follow-up and next steps

Hi Paul, Sami,

Thank you both for Friday, and congratulations again on the £1.5m deal, Paul.

One thing I want to answer properly, because I didn't do it justice on the call: the platform does not need anyone to retype data. It reads what your systems already hold — Vigo through its API, Tachomaster through an API or the scheduled email reports you already receive, and your accounts — and does the joining-up itself. Manual entry is only for things no system holds today, such as walkaround checks and follow-up actions. Your SharePoint hub would be replaced, not fed.

We're also aligned on what this is: an operator platform that sits on top of Vigo and brings the manual workarounds into one place. It is not a TMS, so routing, invoicing, job booking and drivers' hours stay where they are.

To keep things moving while you're both at full stretch, three small asks:

1. **Tachomaster reports** — could you forward two or three of the scheduled emails (daily odometer and drivers' hours)? I'll build the automated feed into plan vs actual costs and show it working on a 20-minute call.
2. **Vigo** — an introduction to the right contact (via Dagmar) so I can request API documentation and a read-only key.
3. **NDA** — whenever you're ready, Paul.

For your scope session, I've attached a short workbook: which modules are core and which are add-ons, and where each piece of data comes from. Fill in as much or as little as helps; I'll turn it into a proposal and contract within five working days of receiving it.

Once scope is agreed, I'd suggest one onsite day with the operations and transport team to go through the views line by line, then I'll build without needing your time and we review the first version in January.

Have a good weekend.

Sam

Scope workbook for Paul and Samantha

Fill in the “Your call” column with Core, Add-on or Not needed, and the data table with whatever you know. Gaps are fine; they become questions for the onsite day.

Modules

Module	Our suggestion	Your call	What must it show or do?
Director dashboard (five questions)	Core		
Operations manager view	Core		
Transport manager view	Core		
Plan vs actual costs and contribution	Core		
PODs and unbilled work	Core		
Fleet and driver compliance	Core		
Actions and follow-ups	Core		
Policies and procedures (H&S, HR, SOPs)	Core		
Driver app	Add-on		
Customer tracking portal	Add-on		
Cash and invoice finance	Add-on		
Driver cover planning	Add-on		

Data sources

Data	System today	How it could be read	Contact	Notes
Jobs, customers, allocations, POD status	Vigo	API (verbal yes via Dagmar) or scheduled export	Dagmar	
Driver hours, infringements, daily odometer	Tachomaster	Scheduled email reports now; API if requested specifically	Paul	
Invoices, debtors, payments	Accounts (Xero?)	Read-only connection or export		
Invoice finance position	Bibby?	Statement export		
Fuel	Fuel card supplier?	Supplier report or export		
Vehicle location, mileage, waiting time	Telematics supplier?	Supplier API or report		
Policies, procedures, H&S and HR documents	SharePoint	Read-only link to the existing library		
Walkaround checks	Paper	Driver app (if chosen)		

Questions to settle

1. Who signs off scope on Trans Haul's side while Paul is stretched?
2. Which three things would the operations manager and the transport manager check first every morning?
3. Which manual spreadsheets or SharePoint pages should this replace on day one?
4. Price point you think other hauliers would pay per month, and for which modules?
5. How should resale through Clearpath work: who sells, who supports, how revenue is shared?
